Namespace Index

1.1 Package List

Here are the packages with brief descriptions (if available):

Chapter 2

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Chapter 4

Namespace Documentation

4.1 uvsim.opcodes Namespace Reference

Variables

- int **READ** = 10 ∗ 100
- int **WRITE** = 11 ∗ 100
- int **LOAD** = 20 ∗ 100
- int **STORE** = 21 ∗ 100
- int **ADD** = 30 ∗ 100
- int **SUBTRACT** = 31 ∗ 100
- int **DIVIDE** = 32 ∗ 100
- int **MULTIPLY** = 33 ∗ 100
- int **BRANCH** = 40 ∗ 100
- int **BRANCHNEG** = 41 ∗ 100
- int **BRANCHZERO** = 42 ∗ 100
- int **HALT** = 43 ∗ 100

4.1.1 Detailed Description

```
In this file, there are constants defined for all our opcodes. This way, we can
more easily write programs, like this:
```
```
program = [
    WRITE + 1, # Because WRITE = 11 * 100, this puts 1101 in $0
    123, # This puts 123 in $1
    HALT
]
CPU(program)
CPU.run_until_halt()
```
```

When this program is run, it will print 123, then halt.
```

5.1.1 Detailed Description

```
The App class represents the main application that integrates the
UVSim simulator with a graphical user interface (GUI).
It extends both the CPU class and the tk.Tk class to manage the
CPU state and the GUI.
```

5.1.2 Constructor & Destructor Documentation

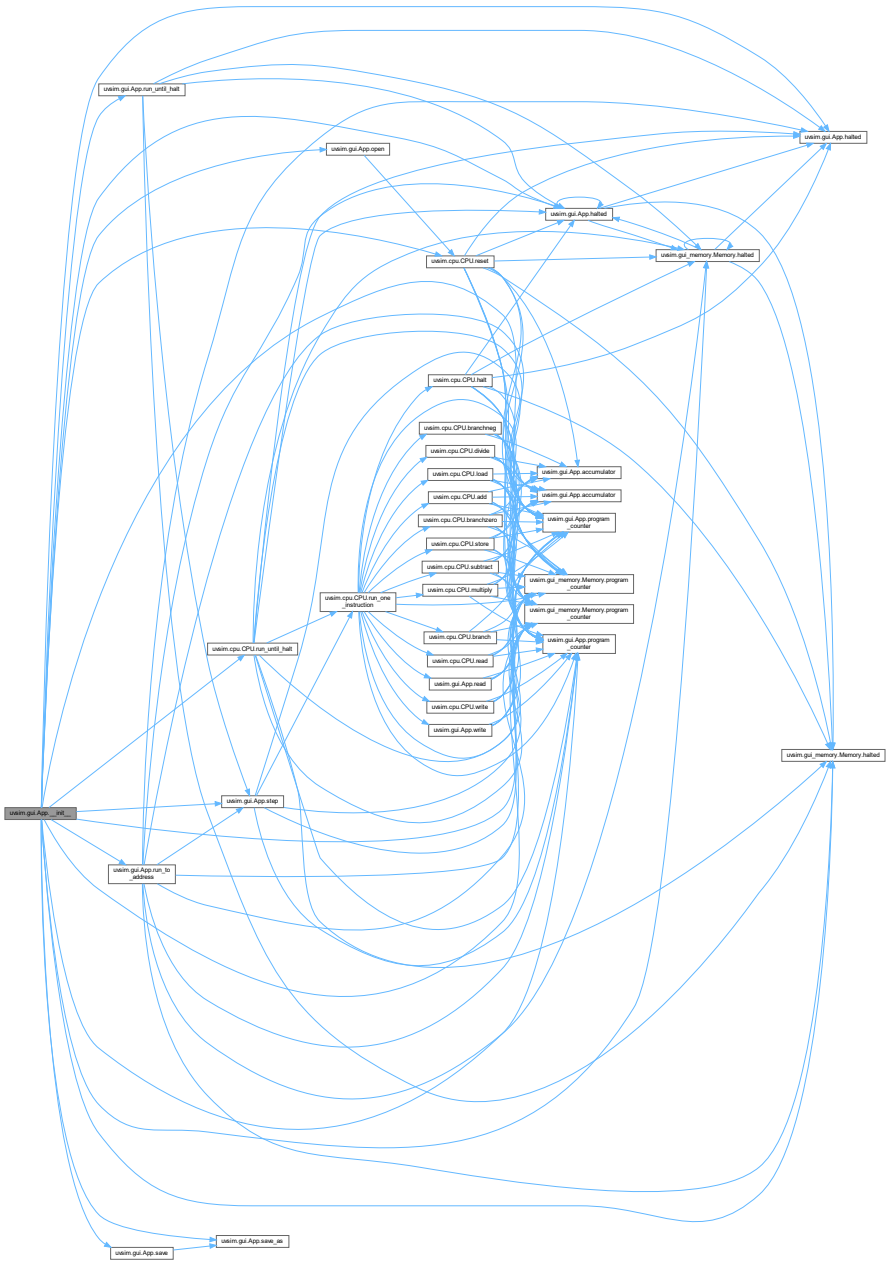
5.1.2.1 __init__()

```
None uvsim.gui.App.__init__ (
              self,
             list[int] memory,
             str | None  screenName = None,
             str | None  baseName = None,
             str  className = "Tk",
             bool  useTk = True,
             bool  sync = False,
             str | None  use = None )
```

```
Purpose:
    Initializes the UVSim application with the specified memory and sets up the GUI.
Input Parameters:
    memory: An array representing the memory of the CPU.
    screenName, baseName, className, useTk, sync, use: Parameters passed to the tk.Tk constructor.
Return Value:
    None.
```

Reimplemented from **uvsim.cpu.CPU** (p. 24).

Here is the call graph for this function:



5.1.3 Member Function Documentation

5.1.3.1 accumulator() [1/2]

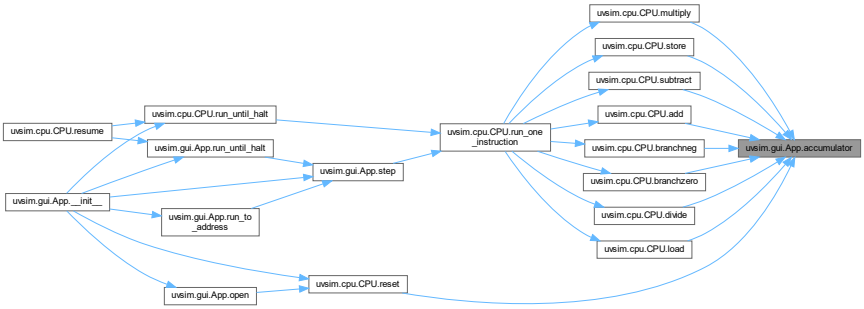
```
uvsim.gui.App.accumulator (
            self )
```

```
Purpose:
    Getter and setter for the accumulator property.
```

```
Input Parameters:
    None.
Return Value:
    The current value of the accumulator.
```

Reimplemented from **uvsim.cpu.CPU** (p. 24).

Here is the caller graph for this function:

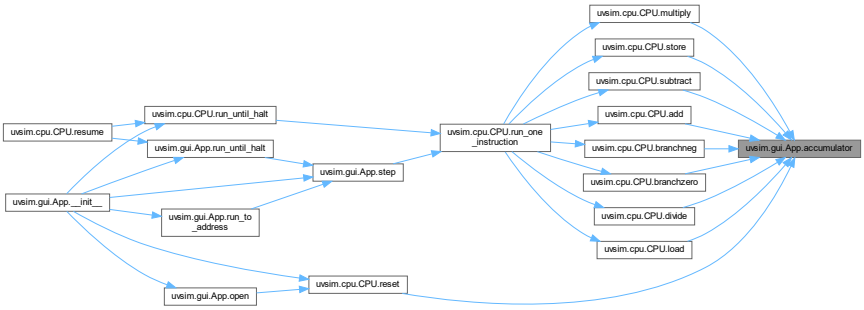


5.1.3.2 accumulator() [2/2]

```
uvsim.gui.App.accumulator (
            self,
            value )
```

Reimplemented from **uvsim.cpu.CPU** (p. 24).

Here is the caller graph for this function:



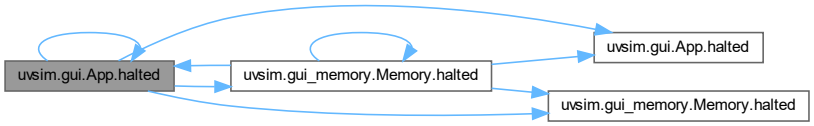
5.1.3.3 halted() [1/2]

```
uvsim.gui.App.halted (
            self )
```

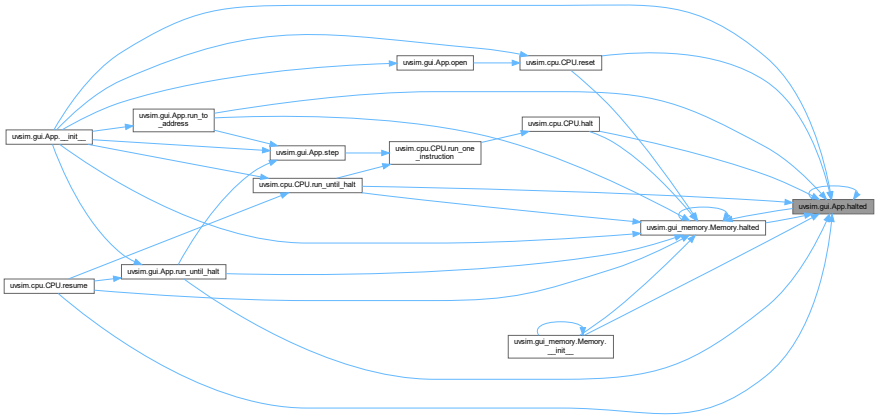
```
Purpose:
    Getter and setter for the halted property.
Input Parameters:
    None.
Return Value:
    True if the CPU is halted, False otherwise.
```

Reimplemented from **uvsim.cpu.CPU** (p. 24).

Here is the call graph for this function:



Here is the caller graph for this function:

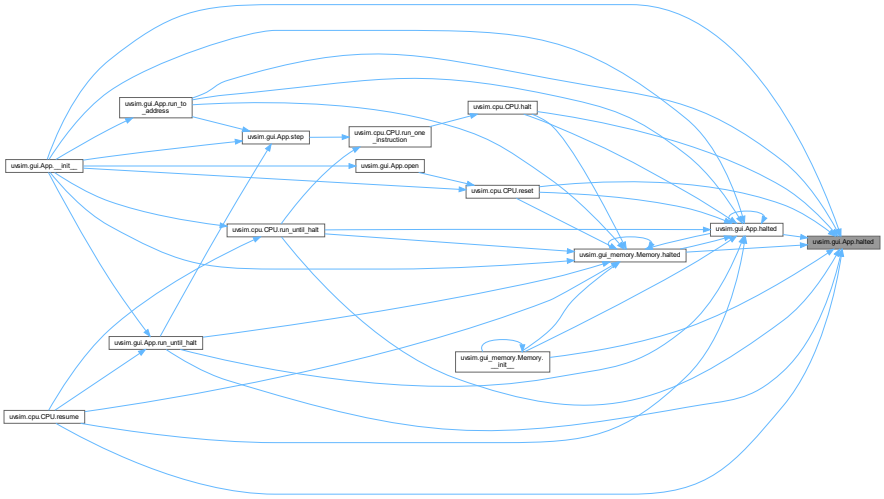


5.1.3.4 halted() [2/2]

```
uvsim.gui.App.halted (
              self,
              value )
```

Reimplemented from **uvsim.cpu.CPU** (p. 24).

Here is the caller graph for this function:

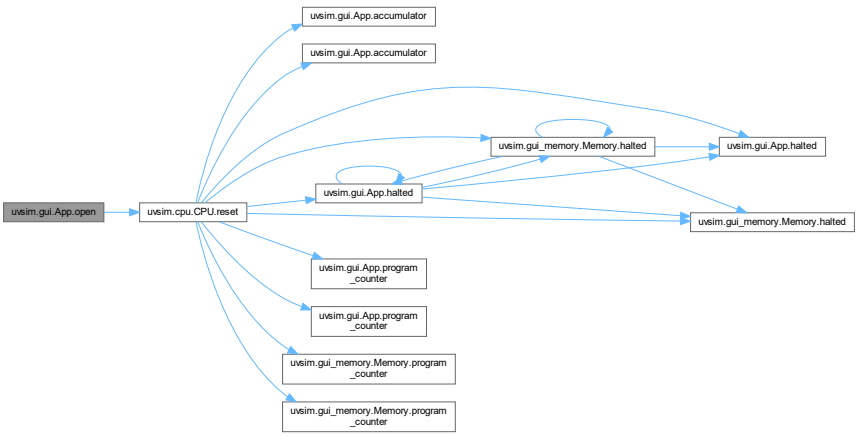


5.1.3.5 open()

```
uvsim.gui.App.open (
              self )
```

```
Purpose:
    Opens a file dialog to allow the user to select a file and loads its content into the CPU memory.
Input Parameters:
    None.
Return Value:
    None.
```

Here is the call graph for this function:



Here is the caller graph for this function:

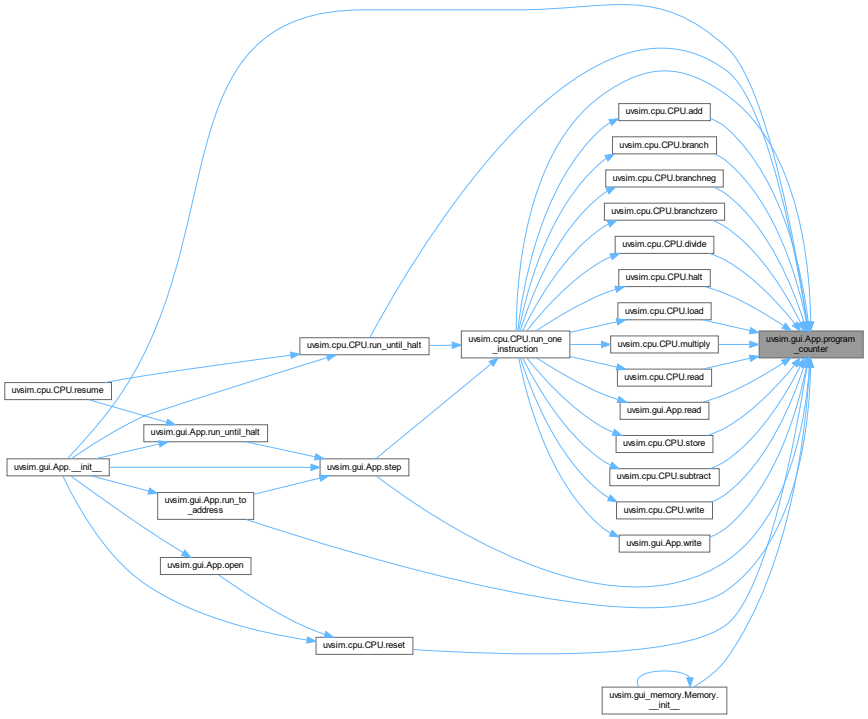
5.1.3.6 program_counter() [1/2]

```
uvsim.gui.App.program_counter (
              self )
```

```
Purpose:
    Getter and setter for the program counter property.
Input Parameters:
    None.
Return Value:
    The current value of the program counter.
```

Reimplemented from **uvsim.cpu.CPU** (p. 24).

Here is the caller graph for this function:

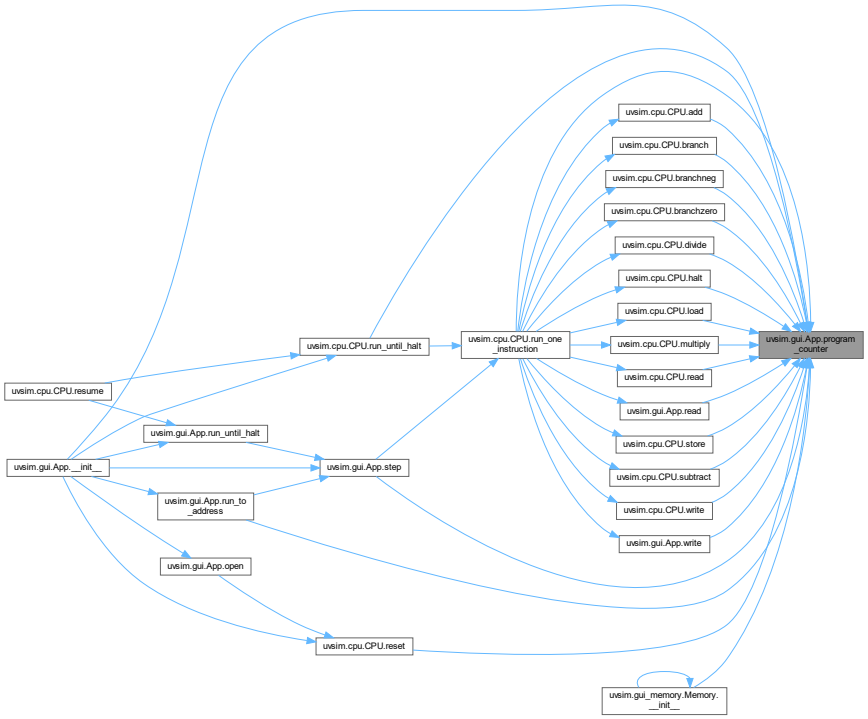


5.1.3.7 program_counter() [2/2]

```
uvsim.gui.App.program_counter (
              self,
              value )
```

Reimplemented from **uvsim.cpu.CPU** (p. 24).

Here is the caller graph for this function:



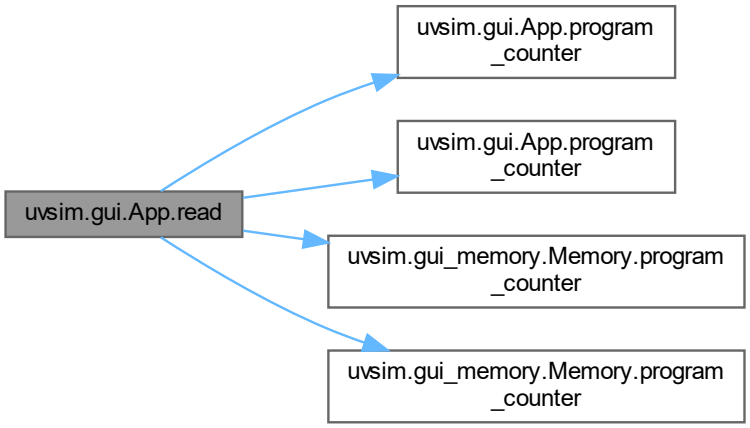
5.1.3.8 read()

```
uvsim.gui.App.read (
              self,
              data,
              user_input = False )
```

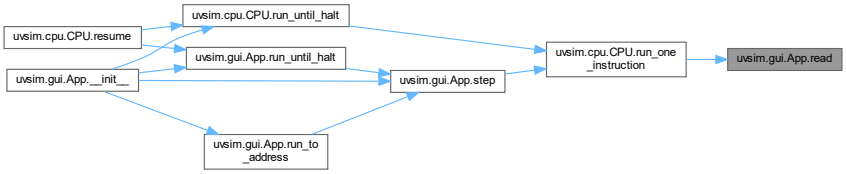
```
Purpose:
    Reads input from the user using a dialog box and stores it in memory.
Input Parameters:
    data: The memory location where the input will be stored.
    user_input: User-provided input. If not provided, input is obtained through a popup.
Return Value:
    An error code indicating the result of the operation.
```

Reimplemented from **uvsim.cpu.CPU** (p. 33).

Here is the call graph for this function:



Here is the caller graph for this function:

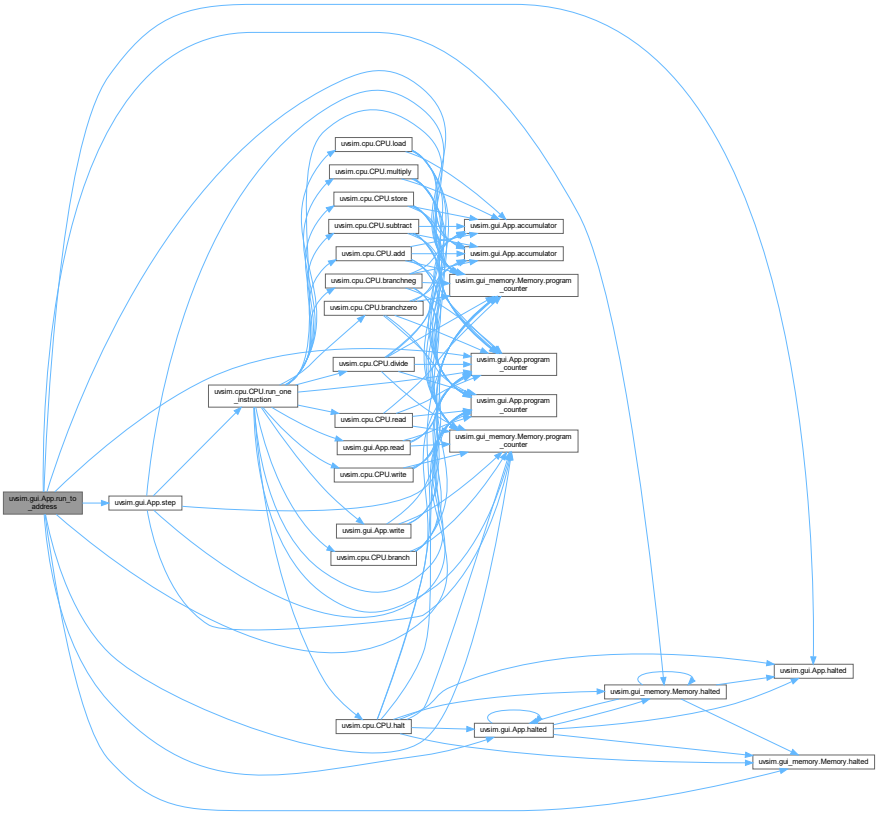


5.1.3.9 run_to_address()

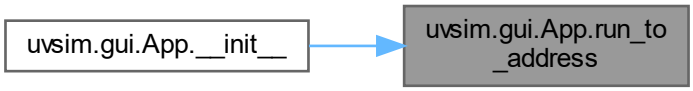
```
uvsim.gui.App.run_to_address (
              self )
```

```
Purpose:
    Executes instructions until the program counter reaches the specified address and displays an error messag
Input Parameters:
    None.
Return Value:
    None.
```

Here is the call graph for this function:



Here is the caller graph for this function:



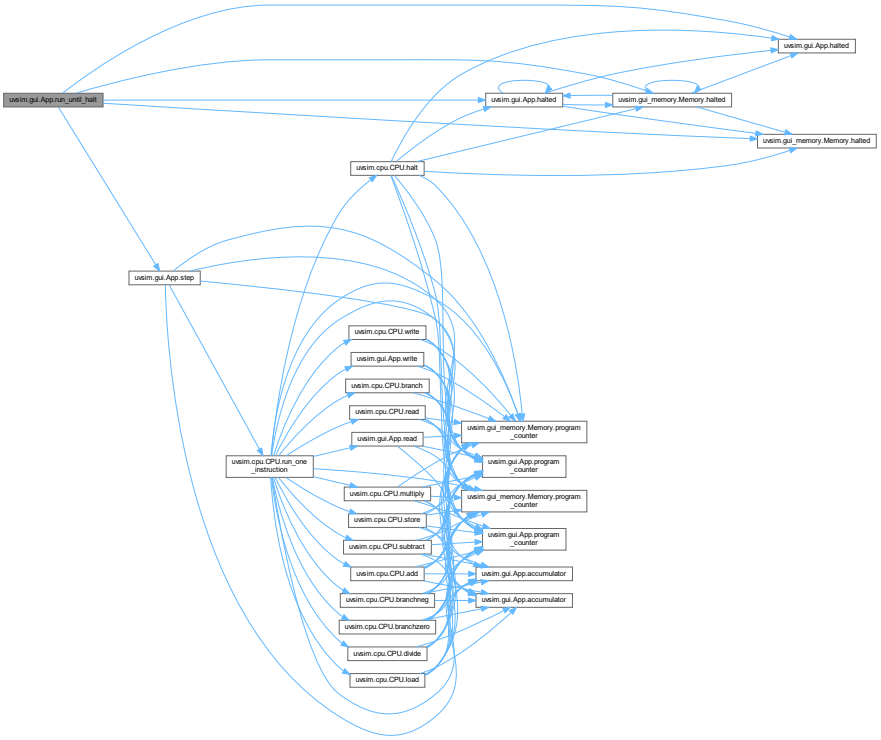
5.1.3.10 run_until_halt()

```
uvsim.gui.App.run_until_halt (
              self )
```

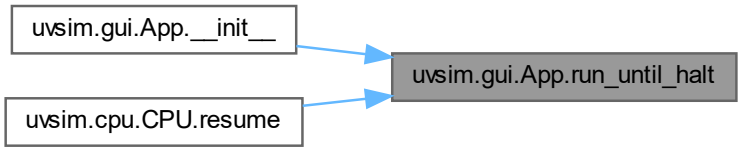
```
Purpose:
    Executes instructions until the CPU is halted and displays an error message if applicable.
Input Parameters:
    None.
Return Value:
    None.
```

Reimplemented from **uvsim.cpu.CPU** (p. 37).

Here is the call graph for this function:



Here is the caller graph for this function:



5.1.3.11 save()

```
uvsim.gui.App.save (
              self )
```

```
Purpose:
    Saves the current memory content to the previously opened or saved file path.
Input Parameters:
    None.
Return Value:
    None.
```

Here is the call graph for this function:

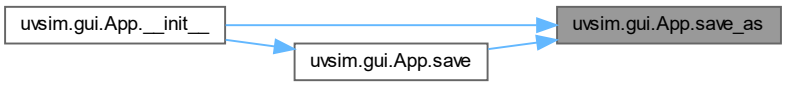
Here is the caller graph for this function:

5.1.3.12 save_as()

```
uvsim.gui.App.save_as (
              self )

Purpose:
    Opens a file dialog to allow the user to save the current memory content to a new file.
Input Parameters:
    None.
Return Value:
    None.
```

Here is the caller graph for this function:

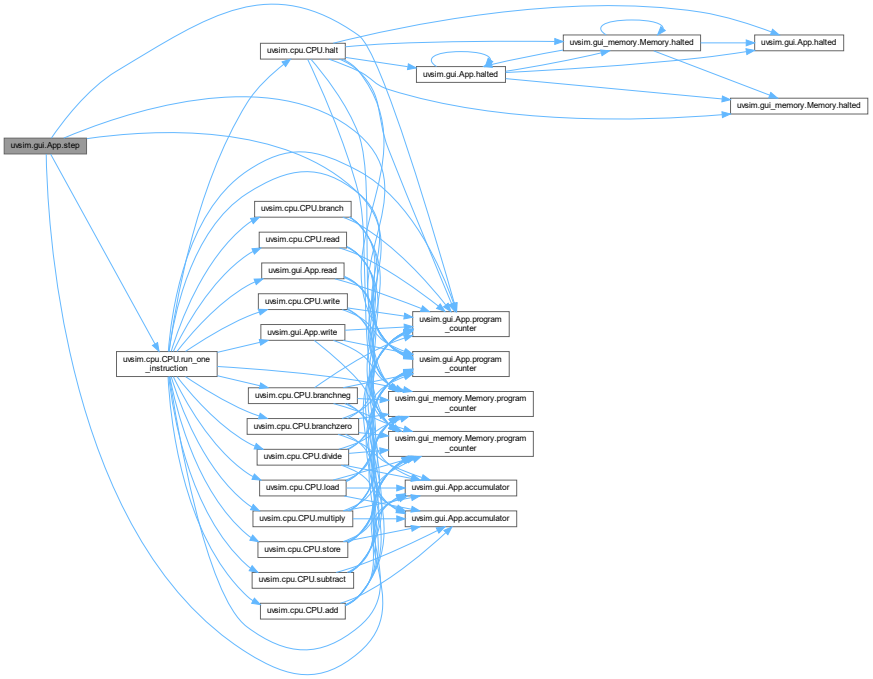


5.1.3.13 step()

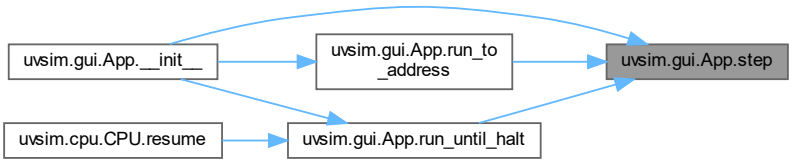
```
uvsim.gui.App.step (
              self )
```

```
Purpose:
    Executes a single instruction and displays an error message if applicable.
Input Parameters:
    None.
Return Value:
    The result of the instruction execution.
```

Here is the call graph for this function:



Here is the caller graph for this function:



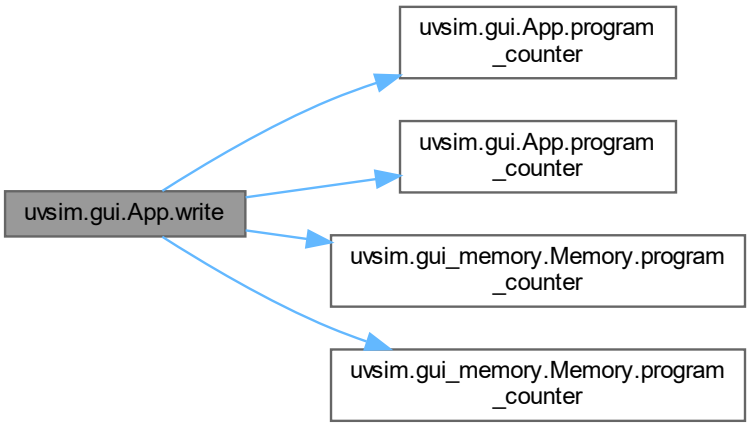
5.1.3.14 write()

```
uvsim.gui.App.write (
              self,
              data )

Purpose:
    Writes a word from memory to a popup.
Input Parameters:
    data: The memory location of the word that will be written.
Return Value:
    An error code indicating the result of the operation.
```

Reimplemented from **uvsim.cpu.CPU** (p. 40).

Here is the call graph for this function:



Here is the caller graph for this function:

5.2.1 Detailed Description

```
CPU Class
Purpose of the Class
The CPU class represents a Central Processing Unit that does instructions stored in memory.
It interacts with memory and does various operations based on the opcode of the current instruction.

Class Attributes:
    self.accumulator : An integer that stored the data we are working with.
    self.program_counter : An Integer that counts the steps in the program
    self.memory : An array that represents the memory of the CPU
    self.halted : A boolean value that represents the state of the program
```

5.2.2 Constructor & Destructor Documentation

5.2.2.1 __init__()

```
uvsim.cpu.CPU.__init__ (
              self,
              memory )
```

Reimplemented in **uvsim.gui.App** (p. 11).

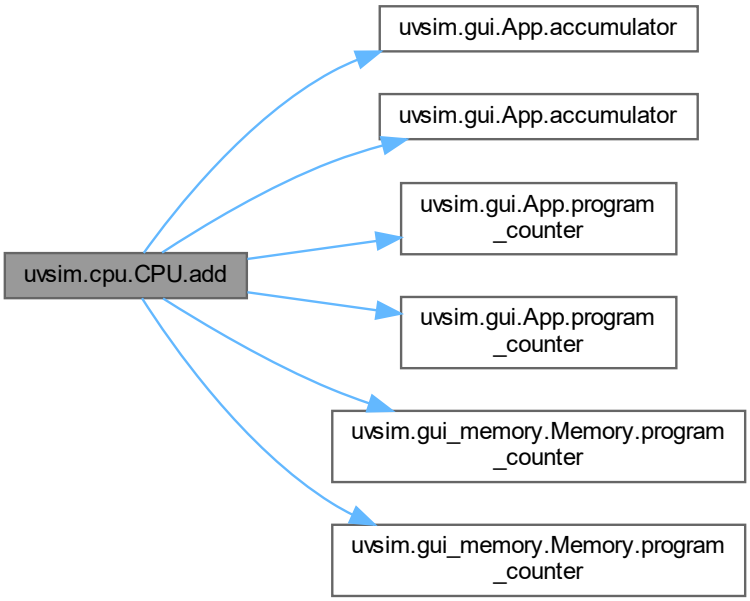
5.2.3 Member Function Documentation

5.2.3.1 add()

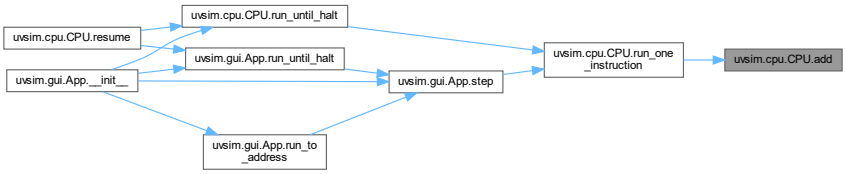
```
uvsim.cpu.CPU.add (
              self,
              data )
```

```
Purpose:
    Adds the value at a specified memory location to the accumulator.
Input Parameters:
    data: The memory location of the value that will be added.
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The accumulator is updated with the addition result.
```

Here is the call graph for this function:



Here is the caller graph for this function:

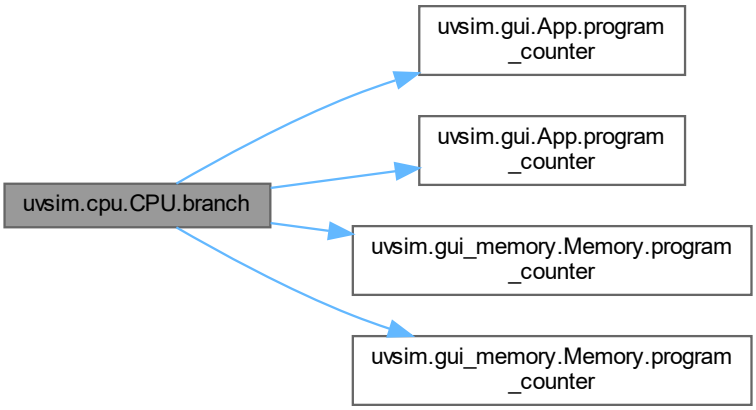


5.2.3.2 branch()

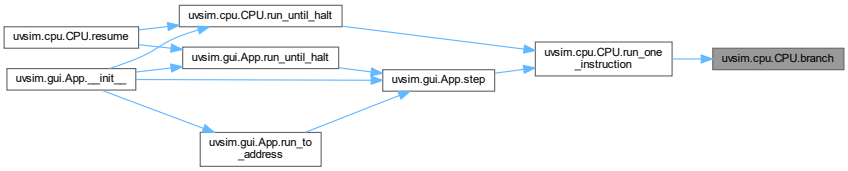
```
uvsim.cpu.CPU.branch (
             self,
             data )
```

```
Purpose:
    Branches to a specified memory location unconditionally.
Input Parameters:
    data: The memory location to branch to.
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
The program counter is updated with the branch address.
```

Here is the call graph for this function:



Here is the caller graph for this function:

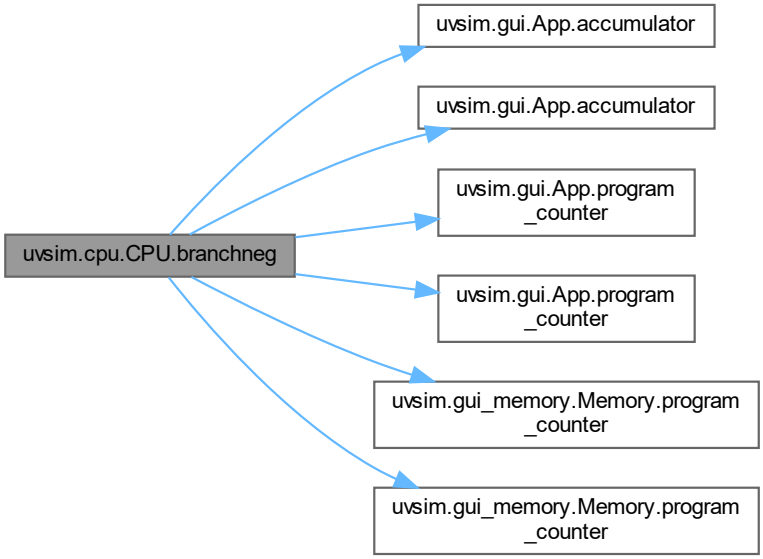


5.2.3.3 branchneg()

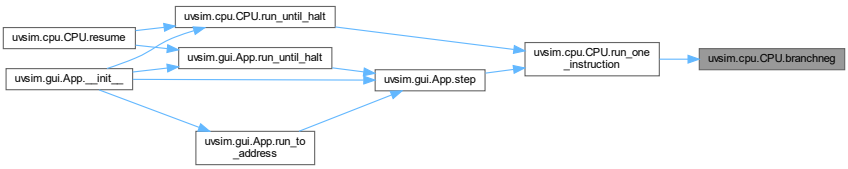
```
uvsim.cpu.CPU.branchneg (
              self,
              data )
```

```
Purpose:
    Branches to a specified memory location if the accumulator is negative.
Input Parameters:
    data: The memory location to branch to if the accumulator is negative.
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The program counter may be updated based on the accumulator value.
```

Here is the call graph for this function:



Here is the caller graph for this function:

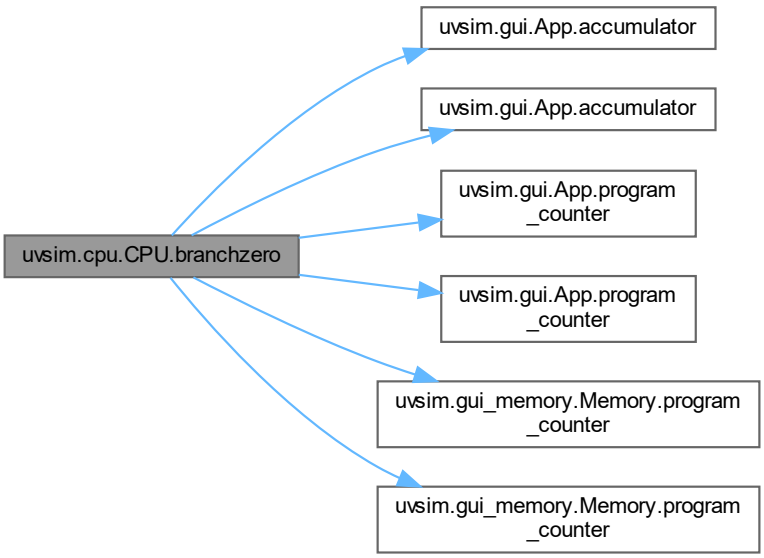


5.2.3.4 branchzero()

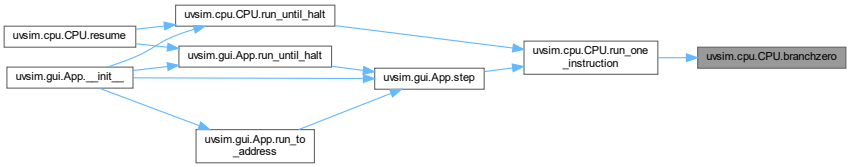
```
uvsim.cpu.CPU.branchzero (
              self,
              data )
```

```
Purpose:
    Branches to a specified memory location if the accumulator is zero.
Input Parameters:
    data: The memory location to branch to if the accumulator is zero.
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The program counter may be updated based on the accumulator value.
```

Here is the call graph for this function:



Here is the caller graph for this function:

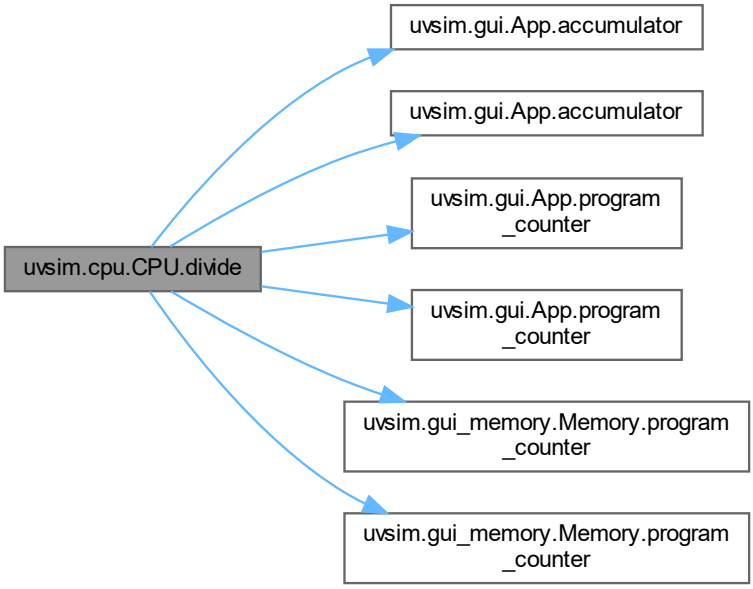


5.2.3.5 divide()

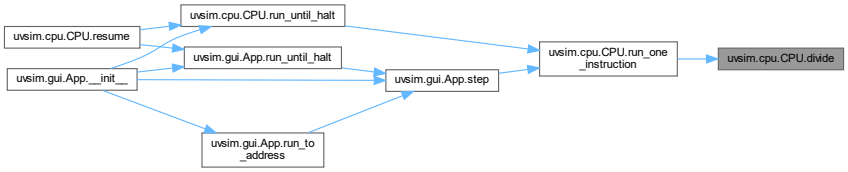
```
uvsim.cpu.CPU.divide (
              self,
              data )
```

```
Purpose:
    Divides the accumulator by the value at a specified memory location.
Input Parameters:
    data: The memory location of the number that will be divided.
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
    The divisor can't be zero.
Post-conditions:
    The accumulator is updated with the division result.
```

Here is the call graph for this function:



Here is the caller graph for this function:

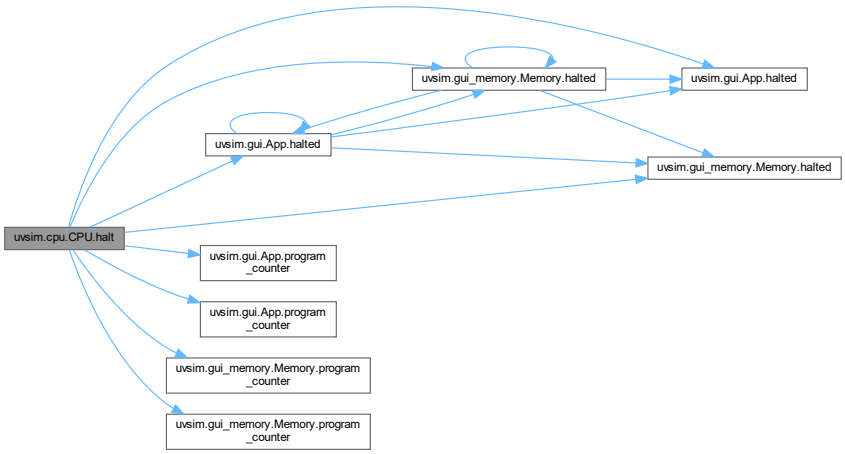


5.2.3.6 halt()

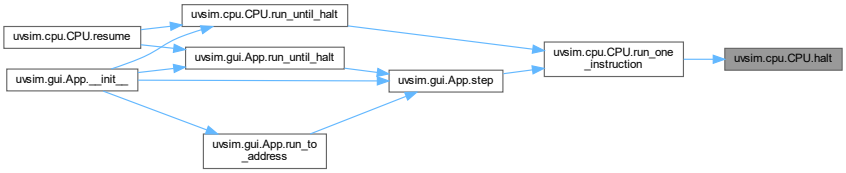
```
uvsim.cpu.CPU.halt (
            self,
            data )
```

```
Purpose:
    Halts the CPU.
Input Parameters:
    data:
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The CPU is halted.
```

Here is the call graph for this function:



Here is the caller graph for this function:

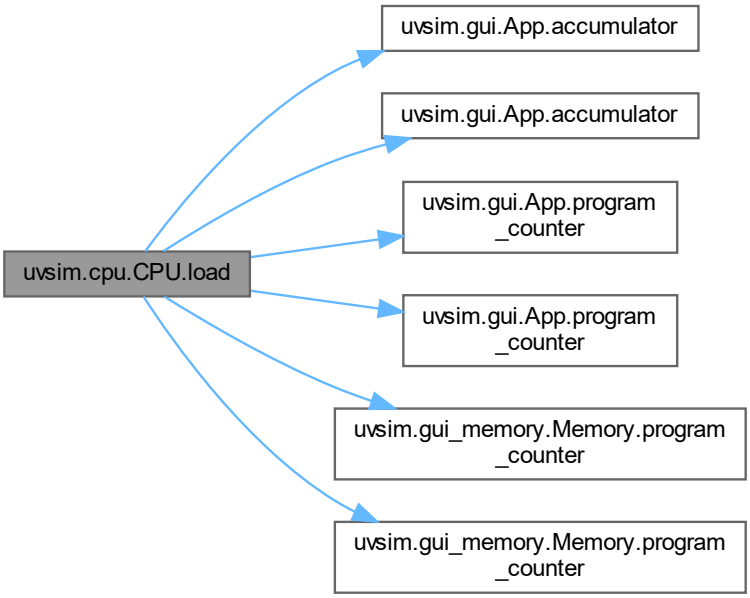


5.2.3.7 load()

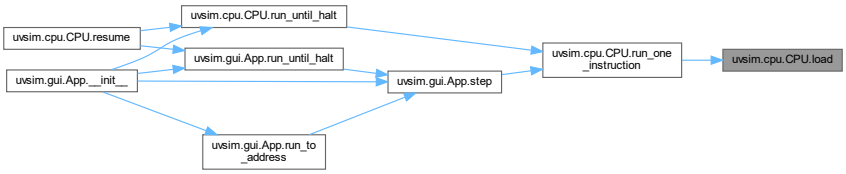
```
uvsim.cpu.CPU.load (
            self,
            data )
```

```
Purpose:
    Loads a word from memory into the accumulator.
Input Parameters:
    data: The memory location of the word that will be loaded.
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The accumulator is updated with the loaded word.
```

Here is the call graph for this function:



Here is the caller graph for this function:

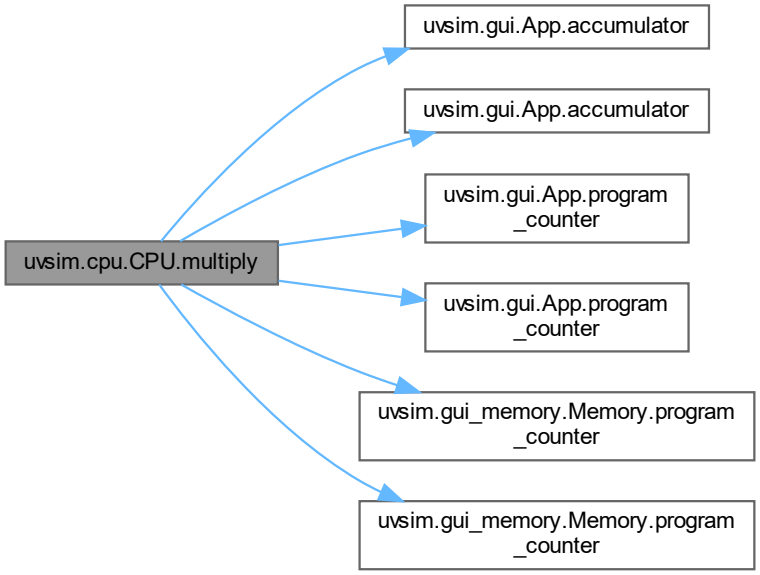


5.2.3.8 multiply()

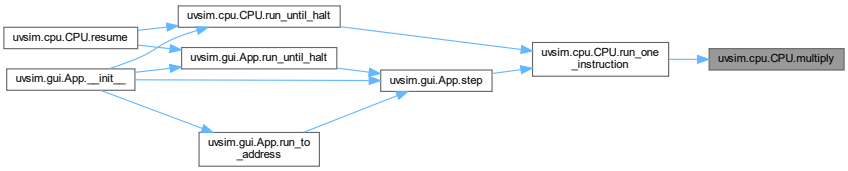
```
uvsim.cpu.CPU.multiply (
            self,
            data )
```

```
Purpose:
    Multiplies the accumulator by the value at a specified memory location.
Input Parameters:
    data: The memory location of the number that will multiply.
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The accumulator is updated with the multiplication result.
```

Here is the call graph for this function:



Here is the caller graph for this function:



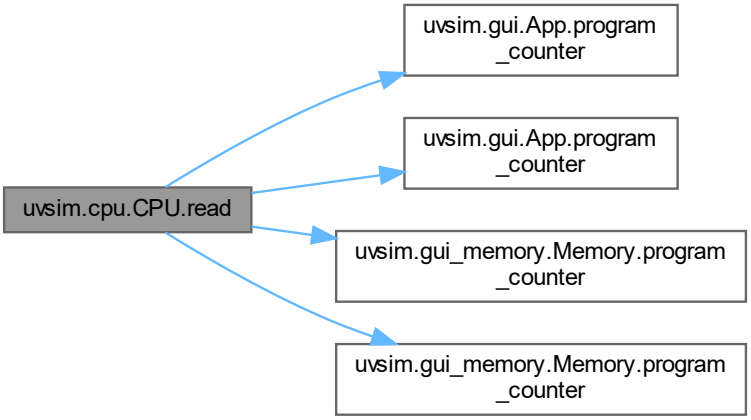
5.2.3.9 read()

```
uvsim.cpu.CPU.read (
            self,
            data,
            user_input = False )
```

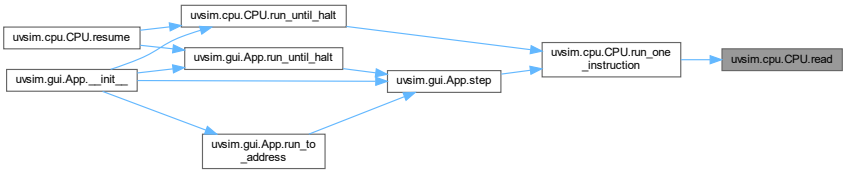
```
Purpose:
    Reads input from the user and stores it in memory.
Input Parameters:
    data: The memory location where the input will be stored.
    user_input: User-provided input.
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The memory location is updated with the user input.
```

Reimplemented in **uvsim.gui.App** (p. 17).

Here is the call graph for this function:



Here is the caller graph for this function:

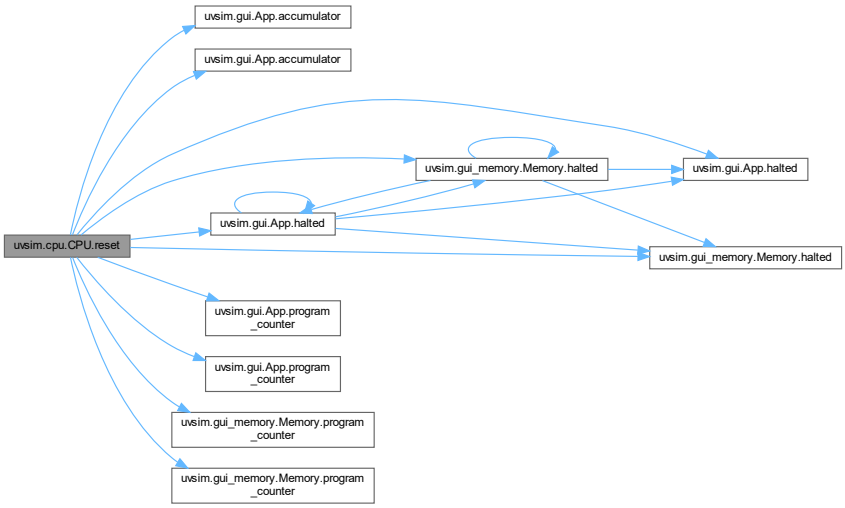


5.2.3.10 reset()

```
uvsim.cpu.CPU.reset (
              self )

Purpose:
    Resets the CPU to its initial state.
Input Parameters:
    None.
Return Value:
    None.
Pre-conditions:
    None.
Post-conditions:
    The CPU is reset to its initial state.
```

Here is the call graph for this function:



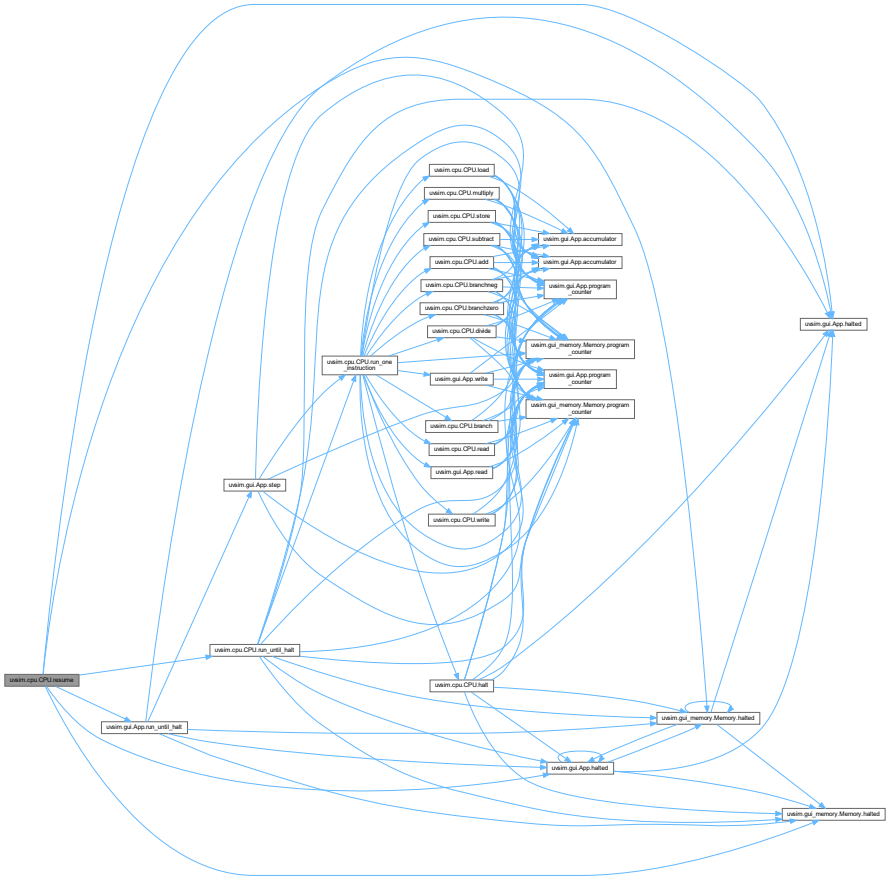
Here is the caller graph for this function:

5.2.3.11 resume()

```
uvsim.cpu.CPU.resume (
              self )

Purpose:
    Resumes execution of the CPU until it is halted.
Input Parameters:
    None.
Return Value:
    None.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The CPU may be halted, and the state of the memory may be modified.
```

Here is the call graph for this function:

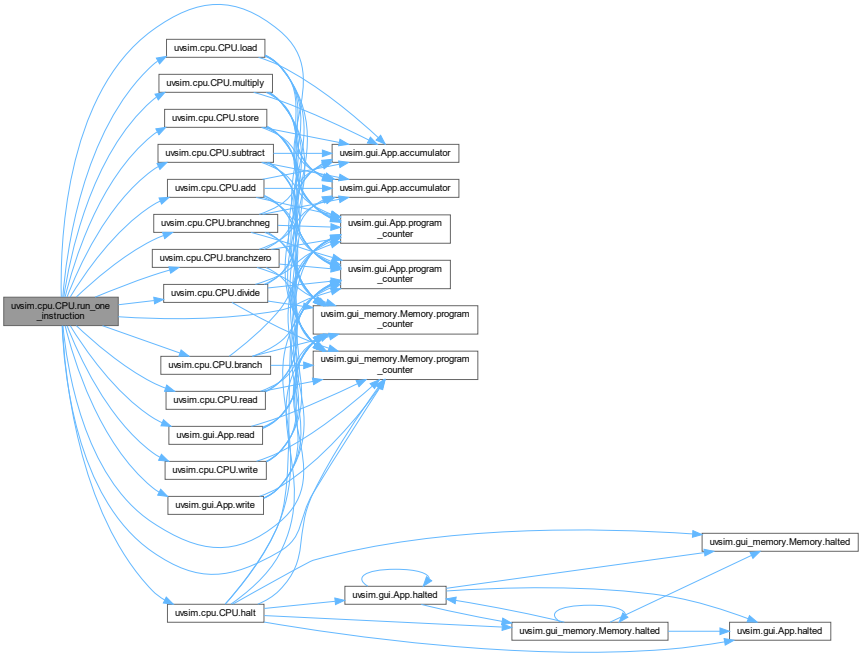


5.2.3.12 run_one_instruction()

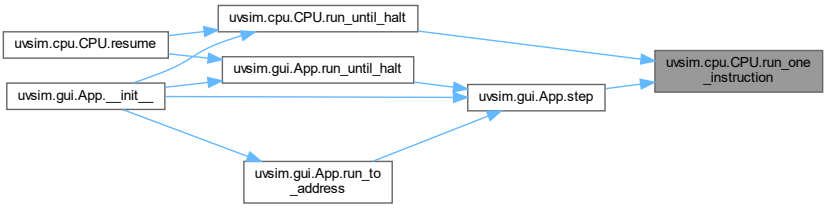
```
uvsim.cpu.CPU.run_one_instruction (
              self )
```

```
Purpose:
    Does a single instruction.
Input Parameters:
    None.
Return Value:
    An error code saying the result of the instruction that was executed.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The state of the memory and CPU registers may be modified.
```

Here is the call graph for this function:



Here is the caller graph for this function:



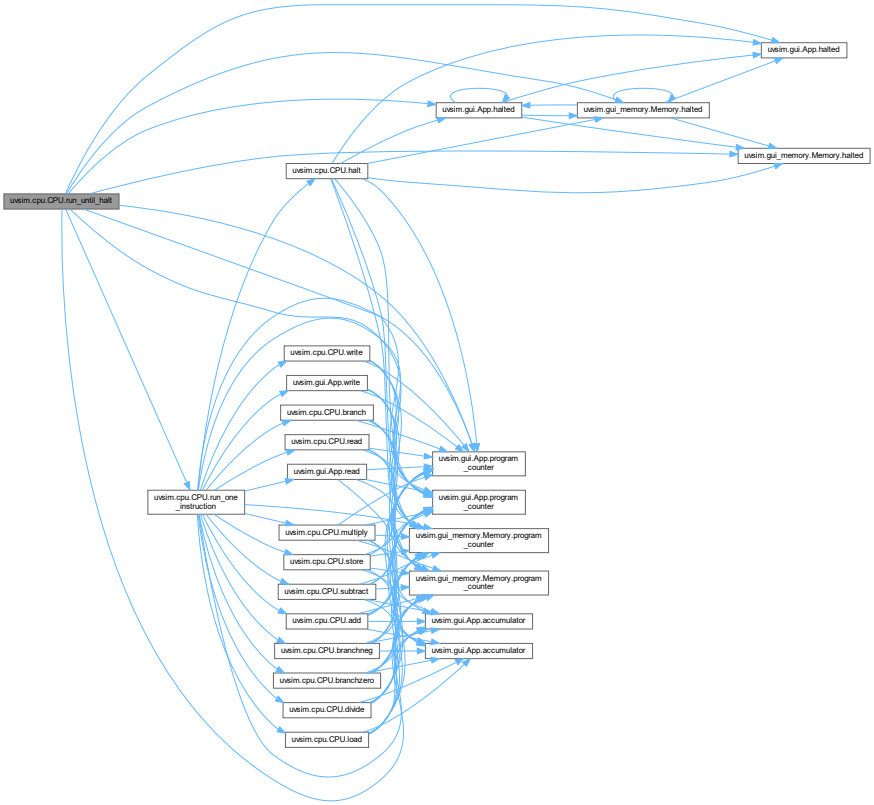
5.2.3.13 run_until_halt()

```
uvsim.cpu.CPU.run_until_halt (
              self )
```

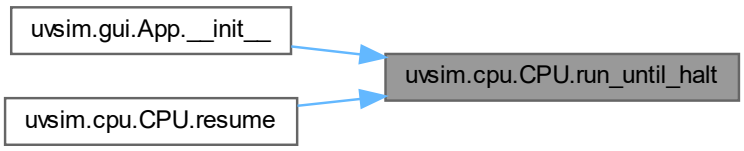
```
Purpose:
    Does instructions in a loop until the CPU is halted.
Input Parameters:
    None.
Return Value:
    An error code with the reason for halting.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The CPU could be halted, and the state of the memory may be modified.
```

Reimplemented in **uvsim.gui.App** (p. 19).

Here is the call graph for this function:



Here is the caller graph for this function:

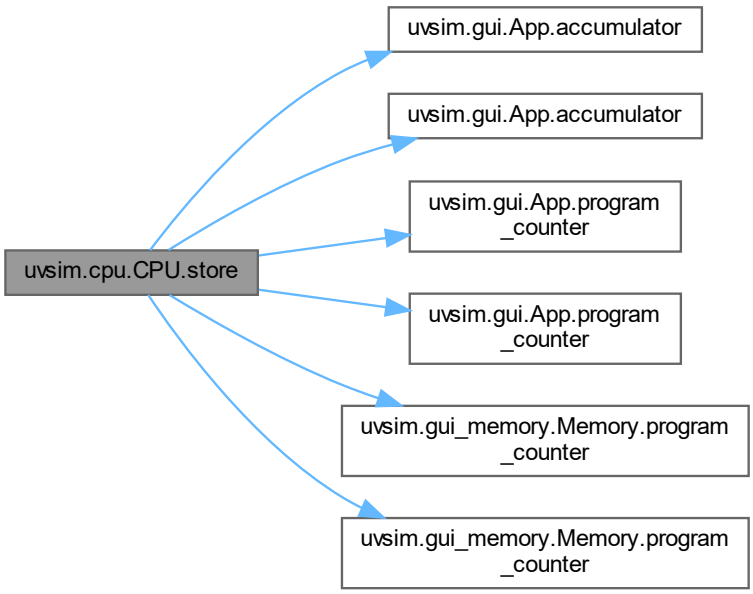


5.2.3.14 store()

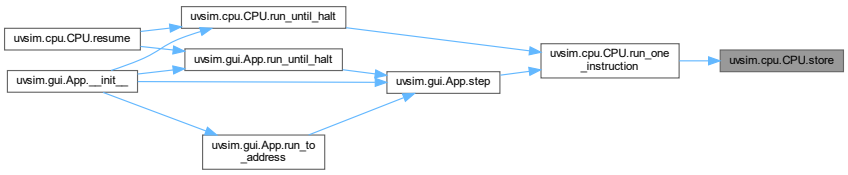
```
uvsim.cpu.CPU.store (
            self,
            data )
```

```
Purpose:
    Stores the value of the accumulator into a memory location.
Input Parameters:
    data: The memory location where the accumulator value will be stored.
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The specified memory location is updated with the accumulator value.
```

Here is the call graph for this function:



Here is the caller graph for this function:

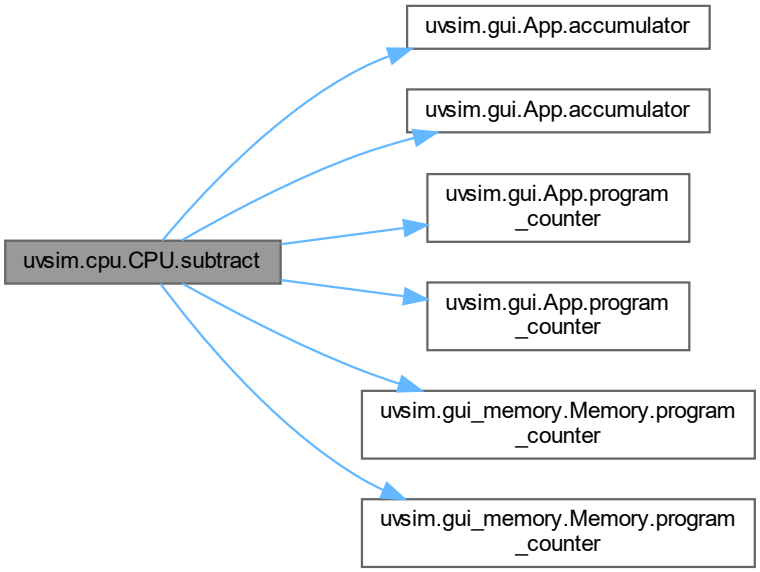


5.2.3.15 subtract()

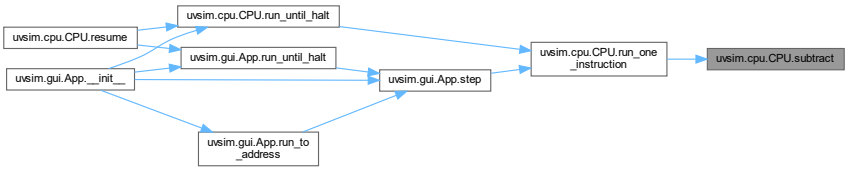
```
uvsim.cpu.CPU.subtract (
            self,
            data )
```

```
Purpose:
    Subtracts the value at a specified memory location from the accumulator.
Input Parameters:
    data: The memory location of the value that will be subtracted.
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The accumulator is updated with the subtraction result.
```

Here is the call graph for this function:



Here is the caller graph for this function:



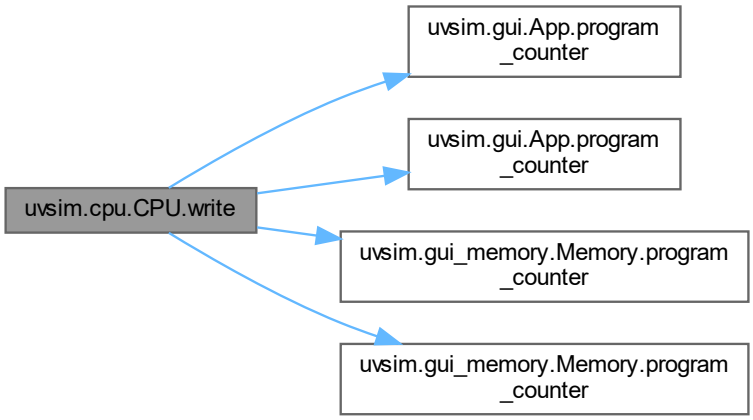
5.2.3.16 write()

```
uvsim.cpu.CPU.write (
            self,
            data )
```

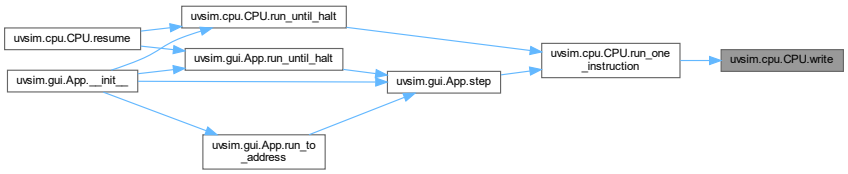
```
Purpose:
    Writes a word from memory to the console.
Input Parameters:
    data: The memory location of the word that will be written.
Return Value:
    An error code showing the result of the operation.
Pre-conditions:
    The CPU needs to be initialized with a valid memory array.
Post-conditions:
    The word is printed to the console.
```

Reimplemented in **uvsim.gui.App** (p. 22).

Here is the call graph for this function:



Here is the caller graph for this function:



5.2.4 Member Data Documentation

5.2.4.1 accumulator

`uvsim.cpu.CPU.accumulator`

Reimplemented in **uvsim.gui.App** (p. 12).

5.2.4.2 halted

`uvsim.cpu.CPU.halted`

Reimplemented in **uvsim.gui.App** (p. 13).

5.2.4.3 program_counter

`uvsim.cpu.CPU.program_counter`

Reimplemented in **uvsim.gui.App** (p. 16).

The documentation for this class was generated from the following file:

- C:/code_projects/school/CS2450/FinalProject/uvsim/cpu.py

5.3 uvsim.gui_memory.Memory Class Reference

5.3.1 Detailed Description

```
The Memory class represents the memory of the UVSim CPU in a GUI.
It inherits from the tk.Frame class.
It gives a visual representation of the memory by crating a grid of memory cells.
```

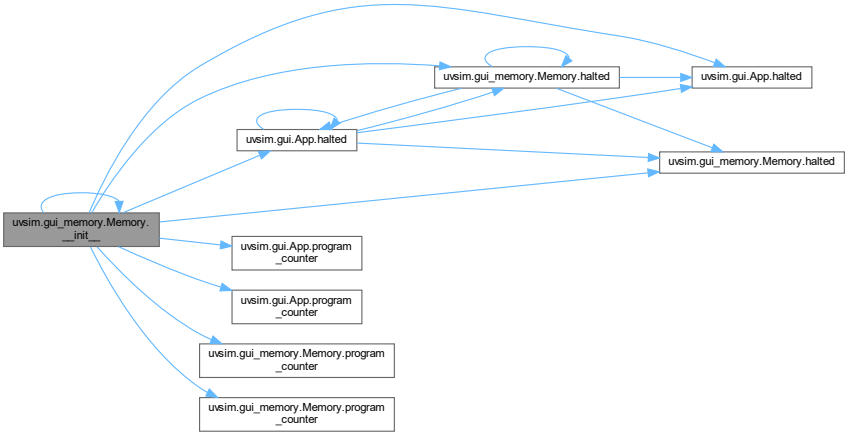
5.3.2 Constructor & Destructor Documentation

5.3.2.1 __init__()

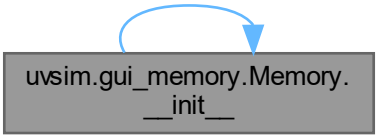
```
None uvsim.gui_memory.Memory.__init__ (
              self,
             list[int] memory,
             tk.Misc | None master,
              vcmd )
```

```
Purpose:
    Initializes the Memory class with the provided memory array and sets up the GUI elements to represent the
Input Parameters:
    memory: An array representing the memory content.
    master: The master widget of the memory frame.
    vcmd: The validation command for memory entries.
Return Value:
    None.
```

Here is the call graph for this function:



Here is the caller graph for this function:



5.3.3 Member Function Documentation

5.3.3.1 __getitem__()

```
uvsim.gui_memory.Memory.__getitem__ (
            self,
            key )
```

```
Purpose:
    Allows accessing the memory content.
Input Parameters:
    key: Index or slice to access the memory content.
Return Value:
    The value at the index or slice.
```

5.3.3.2 __setitem__()

```
None uvsim.gui_memory.Memory.__setitem__ (
             self,
            str key,
             value )

Purpose:
    Allows setting the memory content.
Input Parameters:
    key: Index or slice to set the memory content.
    value: The value that will be set.
Return Value:
    None.
```

5.3.3.3 halted()

```
uvsim.gui_memory.Memory.halted (
             self )

Purpose:
    Getter and setter for the halted property.
    It updates the GUI to highlight the current program counter cell with a different color if the CPU is halt
Input Parameters:
    None.
Return Value:
    True if the CPU is halted, False otherwise.
```

5.3.3.4 program_counter()

```
uvsim.gui_memory.Memory.program_counter (
              self )

Purpose:
    Getter and setter for the program counter property.
    It updates the GUI to highlight the current program counter cell.
Input Parameters:
    None.
Return Value:
    The current value of the program counter.
```

5.4 uvsim.tutorial.Tutorial Class Reference

Public Member Functions

- None **__init__** (self, tk.Tk master)
- **get_next** (self)
- list[str] **open_images** (self)

Public Attributes

- **master**
- **master_frame**
- **upper_frame**
- **image_list**
- **image_count**
- **image_iter**
- **current_image**
- **lower_frame**
- **bttns**

5.4.1 Detailed Description

```
The Tutorial class will display a tutorial for the UVSim application using images.
It creates a simple Tkinter GUI with buttons to navigate through the tutorial images.
```

5.4.2 Constructor & Destructor Documentation

5.4.2.1 __init__()

```
None uvsim.tutorial.Tutorial.__init__ (
              self,
             tk.Tk master )

Purpose:
    Initializes the Tutorial class with the provided master widget and sets up the GUI elements for displaying
Input Parameters:
    master: The master widget of the Tutorial frame.
Return Value:
    None.
```

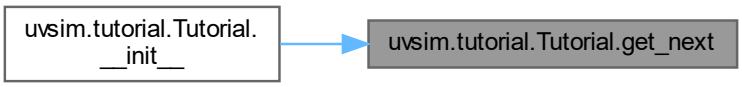
5.4.3 Member Function Documentation

5.4.3.1 get_next()

```
uvsim.tutorial.Tutorial.get_next (
            self )

Purpose:
    Updates the displayed image to the next image in the tutorial when the "Next" button is clicked.
Input Parameters:
    None.
Return Value:
    None.
```

Here is the caller graph for this function:



5.4.3.2 open_images()

```
list[str] uvsim.tutorial.Tutorial.open_images (
            self )

Purpose:
    Opens tutorial images from a specified directory and converts them into Tkinter PhotoImage objects.
Input Parameters:
    None.
Return Value:
    A list of Tkinter PhotoImage objects representing the tutorial images.
```
